## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 2, 6 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Asada et al. (U.S. Patent 5,584,475).

Regarding claim 1, Asada et al. teaches an for transporting sheets into a fixed image reading position, comprising:

a drive roller, 4; and

a pad having a lower layer, 45, made of a flexible material, see column 5, line 49 through column 6, line 24, and an upper layer, 26, provided on the lower layer and made of rigid material in the form of film with a kinetic friction coefficient of 0.2 or less, see column 5, lines 53-56, the pad being biased to the drive roller so that the upper layer contacts a peripheral surface of the drive roller to form a nipping region between the drive roller and the pad by a compressive deformation of the flexible lower layer of the pad, see figures 4 and 6.

Asada et al. does not specifically teach that the kinetic coefficient of friction of the upper layer is .2 or less, however Asada et al. does teach a low coefficient of friction for the upper layer, 26. It would have been obvious to one having ordinary skill in the art at the time the invention was made to provide an upper layer in the apparatus taught by Asada et al. with a coefficient of friction of .02 or less, since it has been held that where the general conditions of a

Art Unit: 3653

claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

Page 3

Regarding claim 2, Asada et al. teach a flexible lower layer, 45, however Asada et al. does not teach that the lower layer has a compressive residual strain of 10% or less. It would have been obvious to one having ordinary skill in the art at the time the invention was made to provide a lower layer in the apparatus taught by Asada et al. with a compressive residual strain of 10% or less, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art.

In re Aller, 105 USPQ 233.

Regarding claim 6, Asada et al. teaches that the pad is biased toward the drive roller by a spring, 40.

Regarding claim 7, Asada et al. teaches an apparatus for transporting sheets into a fixed image reading position, comprising:

a drive roller, 4;

a pad having a rigid backup portion, 5, a lower layer, 45, made of a flexible material and an upper layer, 26, provided on the lower layer and made of rigid material in the form of film with a kinetic friction coefficient of 0.2 or less;

and a spring, 40, which biases the pad to the drive roller so that the upper layer contacts a peripheral surface of the drive roller to form a nipping region between the drive roller and the pad by a compressive deformation of the flexible lower layer of the pad.

Asada et al. does not specifically teach that the kinetic coefficient of friction of the upper layer is .2 or less, however Asada et al. does teach a low coefficient of friction for the upper

Art Unit: 3653

layer, 26. It would have been obvious to one having ordinary skill in the art at the time the invention was made to provide an upper layer in the apparatus taught by Asada et al. with a coefficient of friction of .02 or less, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

Claims 3-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Asada et al. in view of Nakamura et al.

Regarding claim 3, Asada et al. teaches all the features of the claimed invention except for the feature that the upper layer of the pad is made of an electrically conductive material, but Nakamure et al. does teach this feature. Nakamura et al. teaches a separation pad with an upper layer, 33g, made of en electrically conductive material, see figure 29 and column 8, line 4+, for the purpose of converting a change in thickness of an original into an electrical signal, for the purpose of detecting a multi-pick, see abstract. It would have been obvious to one of ordinary skill in the art at the time the invention was made to use electrically conductive material in the apparatus of Asada et al. as taught by Nakamura et al. for the purpose of converting a change in thickness of an original into an electrical signal, for the purpose of detecting a multi-pick.

Regarding claim 4, Asada et al. teaches all the features of the claimed invention except for the feature that the lower layer of the pad is made of an electrically conductive material, but Nakamure et al. does teach this feature. Nakamura et al. teaches a separation pad with a lower layer, 33a, made of en electrically conductive material, see figure 29 and column 8, line 4+, for the purpose of converting a change in thickness of an original into an electrical signal, for the

Art Unit: 3653

purpose of detecting a multi-pick, see abstract. It would have been obvious to one of ordinary skill in the art at the time the invention was made to use electrically conductive material in the apparatus of Asada et al. as taught by Nakamura et al. for the purpose of converting a change in thickness of an original into an electrical signal, for the purpose of detecting a multi-pick.

Regarding claim 5, Asada et al. teaches all the features of the claimed invention except the feature wherein an electrostatic charge generated by a contact the upper layer with the sheet is discharged through the lower layer, but Nakamura et al. does teach this feature, see column 8, lines 4+, for the purpose of converting a change in thickness of an original into an electrical signal, for the purpose of detecting a multi-pick, see abstract. It would have been obvious to one of ordinary skill in the art at the time the invention was made to use electrically conductive material in the apparatus of Asada et al. as taught by Nakamura et al. for the purpose of converting a change in thickness of an original into an electrical signal, for the purpose of detecting a multi-pick.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kaitlin S. Joerger whose telephone number is 571-272-6938. The examiner can normally be reached on Monday - Friday 9-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Mackey can be reached on 571-272-6916. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
